

The Supergoose II is the latest in a long line of good bikes from Mongoose. At \$300 a copy, it's a good bargain.

## IT'S A BIRD! IT'S A PLANE! IT'S SUPERGOOSE II

Virtually everything on the Supergoose comes from Mongoose. That includes the seven-inch one-piece moly crank, above.

Another view of the 'goose: seat is sano and ventilated, gusset at seat tube top is stamped moly sheet, as are head gussets.

## Tall jumps in a single bound

• There are average BMX bikes and then there are the super bikes. In the case of Mongoose's II, the name is well deserved. It's a bike that has got a winning reputation from a company that's just as winning. You really can't beat that.

For a bike that's so expensive (about \$300 on the West Coast), the Supergoose looks relatively bare; you don't see anything loose or stuck on anywhere. This bike means business.

Frame and forks on the 'goose are chrome moly units made by Mongoose; the handlebars are stainless steel which means they won't (or shouldn't) break! Other Mongoose brand goodies abound on the bike: Skinwall tires, front and rear; chain, saddle, grips. Even the one-piece crank is a Mongoose item.

Non-Mongoose things include alloy anodized rims (which look like the tried and true Araya box rims to us) which are laced to low-flange Shimano free hubs. The rear brake (the only brake, in fact) is an unnamed item on the official spec sheet, but looks like a Shimano caliper unit. Pedals on the Mongoose crank are chrome moly KMS MX pedals.

In the hands of a Pro like Mongoose Team racer Tinker Juarez, the Supergoose II is an absolute killer on the track. On the other hand, for the average guy, the Supergoose II is a reasonable bike that won't stand you on your face if you make a mistake. Overall geometry and layout suggests a bike that will forgive you for your mistakes.

There's a million bikes around today which offer a rider the freedom of choice that he/she may want. At a reasonable price, among other things, the Mongoose Supergoose II gives it to you. •
